[Core Title]

Author: Shun (@shun4midx)

[Big Title/Topic Title]

[Subtitle/Question Number]

Box Title

- Typing the whole command for a backslash is annoying so I can just type `\bs` for a \

- Actually, I can ==highlight text== with `\hl` — better yet, I can **bold the highlighted text** with `\hlbf`, or I can *italicize the highlighted text* with `\hlit`.

- I can even highlight the text in green with `\ghl`

- Otherwise I can just **bold stuff** or *italicize stuff* or ***do both***.

- If I want to box my answer that is in plain text , I can do that with `\boxtxt`, or I can box math with standard LaTeX to type one of my favorite time complexities: $O(\alpha^\star(n))$.

C/C++ Code Title, Modify the language in `shun4cmds.tex` if you use another language

```cpp
#include <iostream>

int main() {
    std::cout << "Lorem_ipsum_because_Hello_World_is_quite_boring_ngl.";
    return 0;
}
```

Terminal Command Line Code Title

```
> cd garden
> touch grass
```

Yes, you can type normal text not in boxes too

... and have paragraphs of them.

I rarely use this but I can make a blue big box

With mini text inside

This is a chapter header (The box will be empty)

You can also cite stuff [GT85] that will pop up in your bibliography in your PDF if you include all your references in BibTeX in `references.bib`. Below, you can see how it looks like when cited, because oh how much I love [GT85].
